Integration with 12a assignment

Muhammad Ali Khan

I have made a Node.js app that registers and unregisters webhooks. The app has been deployed on Heroku.

Base URL: https://systemintegration-ea8f23aa1ebc.herokuapp.com

Endpoints:

URL: /webhooks
Method: GET

Description
Returns all webhooks in json format. Example:

```
{
    "webhooks": [
        {
            "id": 1,
            "url": "www.url4.com",
            "eventType": "Register"
        },
        {
            "id": 2,
            "url": "www.url4.com",
            "eventType": "Register"
        }
    ]
}
```

–

URL: /webhooks
Method: POST

Description
Creates or registers a new webhook and returns a confirm or error message. The request body is required to have this format:

```json
{
    "id": 2,
    "url": "www.url4.com",
    "eventType": "Register"
}
```

I have made it so that id has to be set manually, i focus on demonstration and convenience is preferred.
–

URL: /ping
Method: POST

Description
Returns a confirmation message and number of registered webhooks, in json format.
Response example:

```json
{
    "message": "Ping sent",
    "resultCount": 2
}
```

–

URL: /webhooks/:id
Method: DELETE

Description
Deletes webhook specified in the request body. For example:

will delete the URL called www.url4.com and return a confirmation message.
